

NAME

`curl_strequl`, `curl_strnequal` - case insensitive string comparisons

SYNOPSIS

```
#include <curl/curl.h>
```

```
int curl_strequl(char *str1, char *str2);
```

```
int curl_strenqul(char *str1, char *str2, size_t len);
```

DESCRIPTION

The `curl_strequl()` function compares the two strings `str1` and `str2`, ignoring the case of the characters. It returns a non-zero (TRUE) integer if the strings are identical.

The `curl_strnequal()` function is similar, except it only compares the first `len` characters of `str1`.

These functions are provided by libcurl to enable applications to compare strings in a truly portable manner. There are no standard portable case insensitive string comparison functions. These two works on all platforms.

RETURN VALUE

Non-zero if the strings are identical. Zero if they're not.

SEE ALSO

`strcmp(3)`, `strcasecmp(3)`
